

Prompt 1

Now in the next layer build of the tool, we need to add certain things that are

a) funded-partner lists per company

a.1) Funded partners similar to TAP

b) CSR decision-maker names with LinkedIn profiles.

Also as now the tool is ready to be made, the challenge that needs to be mitigated is how to share it, for a use for our senior leadership.

This tool will be like a pre-sales engine, that will help save time, give realistic research without any hallucination and proxy (if needed you double verify it); the output of the results should be in a doc file to be shared with the senior leadership with good visualisation

Further, we need to present this to the Fundraising head and the CEO of the company so give us pointers for that too.

The main aim is to automate research and not compromise on our research quality, on the prelisted sources, not make any made up numbers, have the latest years and be sacrosanct about our work verification.

Prompt 2

There is a current mismatch regarding TAP, TAP does skilling but it doesn't translate into immediate employment as it trains students. This is the about section of TAP:

about tap

21st century Skills for work LI post.png

The most in-demand careers require these 21st century skills.

the problem

21st-century skills and mindsets (critical thinking, self-awareness, complex problem solving, self-confidence, financial literacy) are essential for children to succeed and thrive in the current world.

However, over 60 million low-income middle and high school children in India do not have access to quality services for developing them. The lack of 21st-century skills and mindsets heavily restricts the capacity of children from low-income communities to have healthy personal identities, manage emotions, make independent choices, and achieve individual and collective goals.

unemployment rate.png
1 in 2

Unemployment Rate

Aspiring Minds' National Employability Report indicates that ~47% of Indian graduates are unemployable due to a lack of 21st-century skills.

finlit stat

Financial Illiteracy

According to Streak, a teenage-focused neobank, only 16.7% of Indian teenagers are financially literate.

the solution

We have built an AI and NLP-powered WhatsApp chatbot called TAP Buddy that uses co-curricular electives and self-learning as a medium to develop 21st-century skills for marginalised middle and high school students in India. Our chatbot provides video-based electives and prompts students to perform projects independently via personalised, bot-based nudges and content.

The design of self-learning project videos develops skills like creativity, confidence, self-awareness, communication and problem-solving. They also provide students with world exposure to break their mental barriers and build a growth mindset.

Vision

Enabling all children to become leaders of today and tomorrow.

mission

To empower India's under-served children to become leaders by developing 21st-century skills through our AI and ML-driven WhatsApp chatbot, TAP Buddy.

RECONFIGURE THE VISION AND ALIGNMENT OF TAP TO THIS and focus areas of TAP to more focused and accurate focus areas, so that we get CSR partners that are more aligned to TAP's work in the education space. Also in the CSR research add a filter of which CSR vertical is also engaging implementation partner, for example some CSR might be just funder and some might be implementing arm, so it's important to identify that.

Also make a scoring gradient- if it's more than 90 then want more than 80 then what

Be more strict with scoring all companies cannot be green, the idea is to have companies that are aligned well to us, and the companies which are strong match will be the one that the partnership team will take.

So the better the accuracy, better the pre-sales engine and better turnaround rate of converting the leads into sales.

Prompt 3

Went through the V2 Ericsson run across all four outputs. The architecture is holding: the source hierarchy is labelled, six of seven sources returned, and every claim carries an excerpt and a URL. Good work getting there.

Three defects. The first two need to be in before the tool goes to Mrigalika and Manvi for testing. The third we should fix straight after, but it does not block that release.

1. One run must produce one verdict.

The same Ericsson run currently says three different things. The DOCX leads with 92/100, Priority Match, fast-track, CEO to CEO outreach within 7 days. The XLSX leads with Worth Hunting, 3.0/5. The HTML carries both stacked. A fundraiser acting on the DOCX and a fundraiser acting on the XLSX would do opposite things.

Fix: one computation, one source of truth, rendered identically in HTML, DOCX, XLSX and JSON. If the eight-criterion scorecard is the methodology, the headline must derive from it, not from a separate scoring path.

2. Never assert a fact without a source.

The brief opens with "Ericsson is an EXISTING TAP COLLABORATING PARTNER, relationship already proven." Ericsson is not a TAP partner. There is no citation for that line anywhere in any output, and it repeats in the DOCX executive summary, the XLSX Verdict sheet and the Strategic Insight block.

Fix: every assertion in the Executive Summary and Strategic Insight must carry the same source plus verbatim excerpt discipline as the rest of the engine. If a claim cannot be traced to fetched text, it does not render. This is the highest priority of the three.

3. Matches must be in context, and names must be names.

From the same run:

1. STEM and Coding scored +5 on the keyword "maker". The source text is "Chinese smartphone maker Transsion have reached a settlement resolving their dispute over a multi-year global patent litigation." That is a patent story, not a STEM programme.
2. The "education" focus-area evidence is Ericsson's website navigation bar: "Public sector Defense Public safety Rail Digital airspace Government Research and education Utilities."
3. Three of six decision-maker rows are not names: "sustainability leaders and", "to Present", "at Sandvik in September". Role fields also run into the next person's snippet, so Saharsh David's title reads "...Sumit Kumar - Head- Corporate Social Responsi".
4. The Project Ledger's only entry is "Director @ Praja Foundation 2006-2008 Coordinator Media Init", which is a person's career history, not an Ericsson programme.
5. The delivery-model "implementer signal" quote comes from a profile whose experience line reads NatWest Group, not Ericsson.

Fix: a keyword counts only when it sits inside a CSR or education context window in the same passage, not anywhere on the page. Reject navigation and menu text. Reject strings that do not match a person-name pattern. Cut role fields at the next name boundary. Drop any excerpt whose source page is about a different company.

One note on the verification log. It reports 12/12 verified at 100 percent while a patent-litigation quote sits under STEM evidence. That is because it checks that a string exists in the source, not that the string supports the claim being made. Worth understanding the difference, because right now the log gives false confidence.

Send the same Ericsson run again once the first two are in, and I will do the comparison.
